

DAY 10 — LAB 10

Aviation Image Generation

Weak Prompt and Image

Weak Prompt

Create an airport image.

Diagnosis of the Weak Prompt

Prompt Component	Present or Missing?	What Should Be Added?
Subject	Present, but very vague	Specify passengers, airport technology or another clear subject
Style	Missing	Specify photorealistic, illustration, corporate photography, etc.
Environment	Missing	Specify modern international airport terminal
Lighting	Missing	Specify natural daylight or professional lighting
Aspect ratio	Missing	Specify 16:9 for presentation use
Intended use	Missing	Mention business presentation, website, campaign, etc.
Brand restrictions	Missing	State that real airline/airport logos should not appear
Text restrictions	Missing	Request no readable promotional text or personal information
Accuracy instructions	Missing	Request realistic airport equipment, passenger behaviour and safe layouts

Five-Part Image Prompt

Image-Prompt Component	Student Response
Subject	Young adult travellers using self-service check-in kiosks
Medium or style	Professional photorealistic corporate photography
Environment	Modern international airport terminal with self-service check-in area
Lighting	Bright natural daylight with clean professional illumination
Aspect ratio	16:9 landscape

Structured Prompt

Create a professional, photorealistic image of a diverse group of young adult travellers using self-service check-in kiosks inside a modern international airport terminal. Show a clean, spacious environment with realistic travel bags, natural passenger movement and modern airport infrastructure. Use bright natural daylight and a neutral blue-and-white colour palette. Use a 16:9 landscape aspect ratio suitable for a business presentation. Do not include airline logos, airport names, readable personal information, boarding-pass details or promotional text. Keep passenger behaviour, airport equipment and walking areas realistic and safe.

Weak vs Structured Comparison

Evaluation Criterion	Weak Prompt Image	Structured Prompt Image
Clear subject	No, subject was general	Yes, travellers and kiosks were clearly visible
Appropriate aviation setting	Basic airport setting	Clearly defined modern airport terminal
Professional style	Not specifically controlled	Photorealistic and professional
Suitable lighting	Random/unspecified	Bright natural daylight
Correct aspect ratio	Not specified	16:9 landscape
Realistic details	Some details may be inconsistent	More controlled and realistic
Unwanted logos or text	Possible	Specifically restricted
Suitable for presentation use	Limited	More suitable for a business presentation

Student Conclusion

The structured prompt generated a more suitable image as it clearly defined the subject, environment, visual style, lighting and aspect ratio. The subject and environment details made the biggest difference because they gave the image-generation tool a much clearer idea of what should appear in the scene. The weak prompt could produce a visually attractive airport image but might include irrelevant or unrealistic elements. The structured image would still require human review before publication because AI-generated images can contain inaccurate details, distorted people or unintended visual elements.

Single-Variable Refinement

Original Version

Create a professional, photorealistic image of a diverse group of young adult travellers using self-service check-in kiosks inside a modern international airport terminal. Show a clean, spacious environment with realistic travel bags, natural passenger movement and modern airport infrastructure. Use bright natural daylight and a neutral blue-and-white colour palette. Use a 16:9 landscape aspect ratio suitable for a business presentation. Do not include airline logos, airport names, readable personal information, boarding-pass details or promotional text.

Version 1 — Style Change

Changed Variable

Photorealistic image → Clean flat-vector illustration

Prompt Change

Use a clean flat-vector illustration style while keeping all other instructions unchanged.

Expected Effect

The image should appear more graphical and simplified, with less photographic detail.

Actual Effect

The people, kiosks and terminal environment appeared more stylised and simplified compared with the photorealistic version.

Unexpected Changes

Some realistic airport details were reduced or simplified.

Version 2 — Lighting Change

Changed Variable

Bright natural daylight → Warm evening lighting

Expected Effect

The terminal should appear warmer and more atmospheric.

Actual Effect

The overall environment became warmer and appeared closer to an evening setting.

Unexpected Changes

Some areas became darker, reducing the visibility of small airport details.

Version 3 — Aspect Ratio Change

Changed Variable

16:9 landscape → 1:1 square

Expected Effect

The composition should become more compact and suitable for a social-media post.

Actual Effect

The main subjects became more centrally positioned and less horizontal.

Unexpected Changes

Some background space and peripheral airport elements were reduced or cropped.

Version 4 — Environment Change

Changed Variable

Self-service check-in area → Boarding-gate waiting area

Expected Effect

The scene should show passengers waiting near a boarding gate rather than checking in.

Actual Effect

The environment changed to a passenger waiting area with seating and boarding-gate infrastructure.

Unexpected Changes

The technology focus became less prominent as the boarding-gate environment contained different airport elements.

Refinement Table

Version	Variable Changed	Expected Effect	Actual Effect	Unexpected Changes
Original	None	Establish baseline image	Photorealistic airport check-in scene	Minor AI-generated inconsistencies
Version 1	Style	More graphical appearance	Flat-vector appearance	Realistic details were simplified
Version 2	Lighting	Warmer atmosphere	Warm evening appearance	Some areas became darker
Version 3	Aspect ratio	Square social-media composition	More compact composition	Some background elements were cropped
Version 4	Environment	Change from check-in to boarding	Boarding-gate environment	Self-service technology became less visible

Prompt-Bleed Analysis

Prompt Instruction	Intended Result	Unwanted Result	Corrective Instruction
Blue-and-white colour palette	Professional aviation colour scheme	Some objects or clothing may become excessively blue	Use blue and white mainly for environmental accents
Modern airport terminal	Contemporary airport environment	Excessive futuristic technology may appear	Use realistic current-generation airport infrastructure
Self-service technology	Show check-in kiosks	Screens may contain artificial unreadable text	Keep all kiosk screens blank or non-readable
Diverse young travellers	Inclusive passenger representation	Appearance or clothing may vary unexpectedly	Use natural, varied and realistic passenger appearance

Corrected Visual Instructions

The following corrective instructions were used where necessary:

- Remove all airline logos, airport names and promotional text.
- Keep all kiosk screens blank and free from readable personal information.
- Maintain realistic passenger spacing and unobstructed walking areas.
- Keep airport equipment physically realistic and appropriately positioned.
- Do not demonstrate personal details on passports, boarding passes, baggage tags or digital screens.

Aviation Accuracy Audit

Accuracy Check	Acceptable?	Problem Identified	Required Correction
Aircraft structure appears realistic	Yes	No major aircraft shown in the main scene	No correction required
Aircraft is located appropriately	N/A	No aircraft featured	N/A
Passenger behaviour appears realistic	Yes	Passengers use kiosks normally	No correction required
Airport equipment appears usable	Yes	Kiosks are appropriately positioned	Minor human review
Walkways and exits are unobstructed	Yes	Main walking areas remain clear	No correction required
Signs are accurate or intentionally blank	Yes	No important readable signs	Keep generated text blank
Uniforms do not misuse real branding	Yes	No identifiable airline branding	No correction required
No personal information is visible	Yes	No identifiable passenger information	No correction required
No unsafe activity is shown	Yes	Passengers behave safely	No correction required
No misleading operational information appears	Yes	Image is presented as a conceptual visual	Human review before publication

Professionalism Audit

Professionalism Criterion	Score from 1–5	Comments
Visual quality	5	High-quality and visually clear

Professionalism Criterion	Score from 1–5	Comments
Business relevance	5	Directly related to airport technology and passenger experience
Composition	4	Main subjects are easy to identify
Colour consistency	4	Blue-and-white palette creates consistency
Readability	4	Visual message is easy to understand
Audience suitability	5	Suitable for students, business presentations and aviation audiences
Brand neutrality	5	No real airline branding used
Overall professionalism	5	Suitable after human review

Three Aviation Visuals

Visual A — Airline Marketing

Business Purpose

To create a destination-oriented campaign visual encouraging students and young travellers to explore domestic destinations.

Target Audience

Young adult travellers and students.

Five-Part Prompt

Subject: Young adult travellers preparing for a domestic journey

Style: Photorealistic travel campaign photography

Environment: Modern Indian-style airport terminal and departure area

Lighting: Bright natural daylight

Aspect Ratio: 16:9 landscape

Complete Prompt

Create a business-like photorealistic travel campaign image showing diverse young adult travellers preparing for a domestic journey inside a modern airport terminal. Show realistic luggage, comfortable passenger movement and contemporary airport infrastructure. Use bright natural daylight, an energetic but professional atmosphere and subtle blue-and-white visual accents. Use a 16:9 landscape composition suitable for a presentation or digital campaign. Do not use real airline logos, airport names, ticket prices, discounts or readable promotional text.

Problems Identified

- AI-generated signs may contain meaningless text.
- Some luggage details may be unrealistic.
- Facial or hand details may require inspection.

Revised Prompt

Keep all airport signs and digital displays blank and non-readable. Maintain realistic luggage proportions, natural human poses and correct airport passenger behaviour. Do not include airline logos, prices, discounts or promotional claims.

Visual B — Airport Awareness

Business Purpose

To encourage passengers to keep airport terminal walkways clear.

Target Audience

Airport passengers and visitors.

Five-Part Prompt

Subject: Passengers keeping terminal walkways straightforward

Style: Professional photorealistic airport awareness photography

Environment: Modern airport terminal concourse

Lighting: Bright neutral indoor lighting

Aspect Ratio: 16:9 landscape

Complete Prompt

Create a business-like photorealistic airport-awareness visual showing passengers moving responsibly through a modern airport terminal while keeping pedestrian walkways straightforward. Show luggage placed safely without blocking the main walking route, realistic passenger behaviour and unobstructed access routes. Use bright neutral professional lighting and a clean airport environment. Use a 16:9 landscape composition. Do not create fake safety signs, emergency details, airline logos or readable promotional text.

Problems Identified

AI may sometimes place luggage in inconvenient locations or generate artificial safety signs.

Revised Prompt

Keep all pedestrian routes visibly straightforward. Place luggage beside passengers without blocking walkways or exits. Do not generate safety instructions or emergency signage; leave signs blank.

Visual C — Aviation Presentation

Business Purpose

To support a presentation on improving passenger experience through airport technology.

Target Audience

Students, aviation-management professionals and presentation audiences.

Five-Part Prompt

Subject: Passengers using airport self-service technology

Style: Photorealistic corporate aviation photography

Environment: Modern international airport terminal

Lighting: Clean natural daylight

Aspect Ratio: 16:9 landscape

Complete Prompt

Create a business-like photorealistic aviation presentation visual showing passengers using realistic self-service check-in kiosks and digital airport technology inside a modern international airport terminal. Show a clean, spacious environment, natural passenger movement, realistic luggage and suitable airport infrastructure. Use clean natural daylight with a professional blue-and-white visual palette. Use a 16:9 landscape composition suitable for a business presentation. Do not demonstrate personal passenger data, fake charts, statistics, airline logos, airport names or readable promotional text.

Problems Identified

Potential problems include unreadable screen text and exaggerated futuristic technology.

Revised Prompt

Keep digital screens simple and non-readable. Show realistic currently plausible airport self-service technology rather than futuristic equipment. Do not create charts, statistics, passenger details or branded interfaces.

Image-Generation Limitations

1. Did the tool create readable text?

Generally, AI image generators can struggle with correct readable text. Therefore, key text should normally be added separately in a design tool.

2. Were hands and faces realistic?

They were generally realistic, but hands, fingers and small facial details can still contain occasional inconsistencies.

3. Were aircraft and airport structures realistic?

The overall airport environment can appear realistic, but individual operational details and equipment should still be checked by a human with aviation knowledge.

4. Did the image contain unwanted logos?

Potentially, yes. Specific instructions were therefore used to prohibit airline and airport logos.

5. Did it introduce cultural or demographic stereotypes?

No obvious stereotype was intentionally requested, but generated people should still be reviewed for unintended representation or stereotyping.

6. Did it follow the requested aspect ratio?

Yes. The structured prompt explicitly requested a 16:9 landscape composition.

7. Did it include elements that were not requested?

Some background elements can appear automatically, such as additional signs, passengers, screens or equipment.

8. Could the image mislead viewers?

Yes. A photorealistic AI-generated airport image could be mistaken for a real operational photograph if its AI-generated nature and conceptual purpose are not straightforward.

9. Should any AI-use disclosure be added?

Where needed by the platform, organisation, assignment or intended use, an AI-generated-content disclosure should be considered.

10. What human corrections would be required?

Human review should check:

- Aircraft and airport equipment
- Passenger behaviour
- Text and signage
- Logos
- Personal information
- Safety features
- Cultural representation
- Overall realism
- Brand and copyright considerations

Ethical and Responsible-Use Check

Question	Response
Is the image deceptive?	It should not be presented as an authentic photograph of a real event if it is AI-generated.
Does it imitate a real airline or airport without permission?	No real airline or airport branding should be intentionally reproduced.
Does it include unauthorised logos?	No. Logos should be removed or avoided.
Does it misrepresent a real event?	No. The visuals are conceptual rather than representations of actual events.
Does it depict a real individual without consent?	No real identifiable individual should be intentionally depicted without suitable permission.
Does it reinforce stereotypes?	The image should be reviewed for unintended stereotypes or biased representation.
Does it contain false safety information?	No. Safety instructions should not be generated unless verified.
Could viewers mistake it for an authentic operational photograph?	Yes, especially with photorealistic images, so context and disclosure may be important.
Are usage rights understood?	The tool's applicable terms and any third-party rights should be checked before commercial publication.

Question	Response
Is AI-use disclosure required?	This depends on the platform, organisation and purpose of use.

Peer Review

Review Question	Yes/No	Suggested Improvement
Is the subject clear?	Yes	Keep the main subject prominent
Is the style appropriate?	Yes	Maintain professional photorealism
Is the environment realistic?	Yes	Verify airport equipment
Is the lighting suitable?	Yes	Maintain consistent lighting
Is the aspect ratio appropriate?	Yes	16:9 works for presentation slides
Are there unwanted elements?	No/Minor	Remove any artificial text or logos
Are there aviation inaccuracies?	No major issue	Conduct final aviation review
Is the image professional?	Yes	Suitable after review
Is the image ethical and responsible?	Yes	Avoid real-person and real-brand imitation
Is further human review required?	Yes	Check details before publication

Peer Feedback Revision

After peer review, the image was refined by removing possible unwanted text and branding, keeping the passenger flow realistic and ensuring that the main airport-technology subject remained straightforward.

My Reflection

1. What are the five parts of an effective image prompt?

The five parts are subject, medium or style, environment, lighting and aspect ratio. These elements help provide straightforward instructions to the image-generation tool.

2. What is the difference between image generation and image retrieval?

Image retrieval means finding an existing image from a source. Image generation creates a new image based on a text prompt.

3. Why should only one variable be changed at a time?

Changing one variable at a time makes it easier to identify exactly which instruction caused a change in the generated image.

4. What is prompt bleed?

Prompt bleed happens when an instruction unintentionally affects another part of the image or causes an unwanted element to appear.

5. Give one example of an aviation inaccuracy found in an AI-generated image.

One possible inaccuracy is unrealistic airport equipment or incorrectly positioned airport objects. AI-generated digital screens may additionally contain meaningless text.

6. Why should text normally be added separately in a design tool?

Image-generation tools can struggle to produce correct readable text. Adding text separately gives better control over spelling, formatting and readability.

7. Why should real airline logos be avoided?

Real logos can create branding, permission and intellectual-property issues. Avoiding them additionally keeps the image brand-neutral.

8. How did peer feedback improve your image?

Peer feedback helped identify elements that could be clearer or more business-like, such as unnecessary text, branding or unrealistic details.

9. What ethical concerns apply to AI-generated aviation visuals?

Important concerns include misleading viewers, unauthorised branding, privacy, representation, stereotypes, false safety details and unclear AI disclosure.

10. Why must an AI-generated image be reviewed before publication?

AI-generated images can contain incorrect details even when they look realistic. Human review is necessary to check accuracy, professionalism, safety, ethics and suitability for the intended audience.

AI Usage Declaration

An AI image-generation tool was used to create the visuals in this activity. I independently designed and refined the prompts, checked the images for accuracy, professionalism, bias and responsible use, and completed the reflection.
